

# Network Viva Prep.

## TCP Header

## TCP ACK Generation

inorder arrival; everything ACKed	--> wait 500 ms for next seg
in order one segment has ACK pending	--> send cum ACK
out of order, higher than expected seq#	--> send dup ACK
segment that fills the gap (partial or complete)	--> send ACK

## TCP Fast retransmit

Don't wait for timeout if 3 ACKs for same data is received

# RWND (Receive Window)

TCP code

sender limits number of unACKed packets to rwnd

# Connection Management

Client

Server

SYNSENT

SYN bit = 1, seq = x

SYNRCVD

SYN = 1 seq = y  
ACK = x + 1 ACK bit = 1

ESTAB

ACK bit = 1  
ACK = y + 1

ESTAB

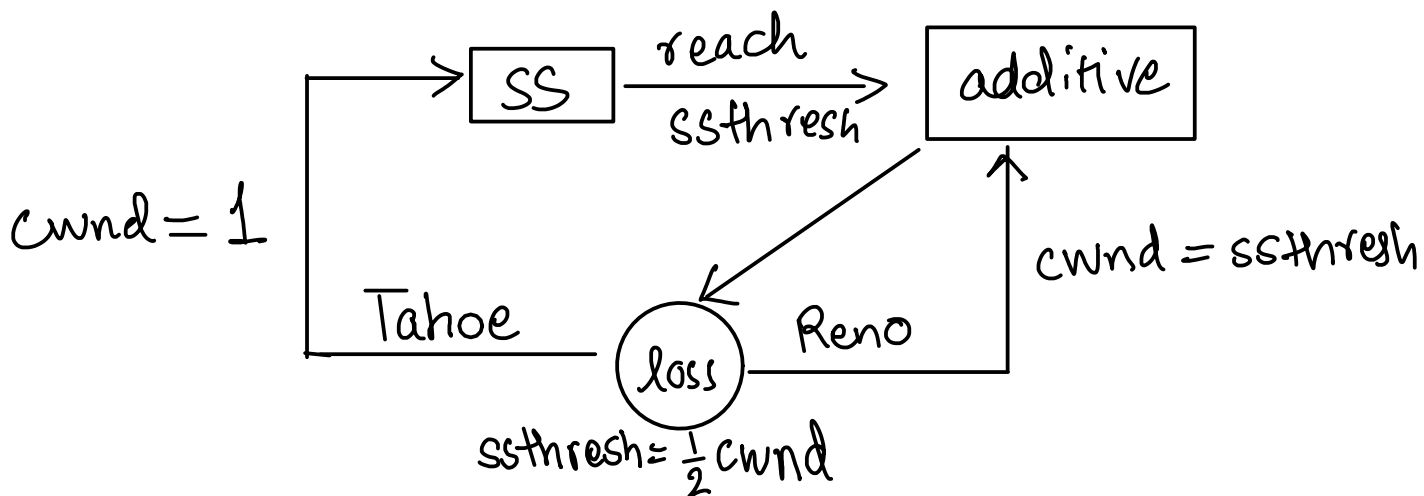

TODO : Connection Close

## TCP Congestion Control

cwnd -> congestion window size

Slow Start -> exponential increase in cwnd

loss -> 3 dup ACKs

# Network Layer

## Virtual Circuit (ATM)

in interface	inVC#	out interface	out VC#

Every router has this table

## Datagram forwarding table

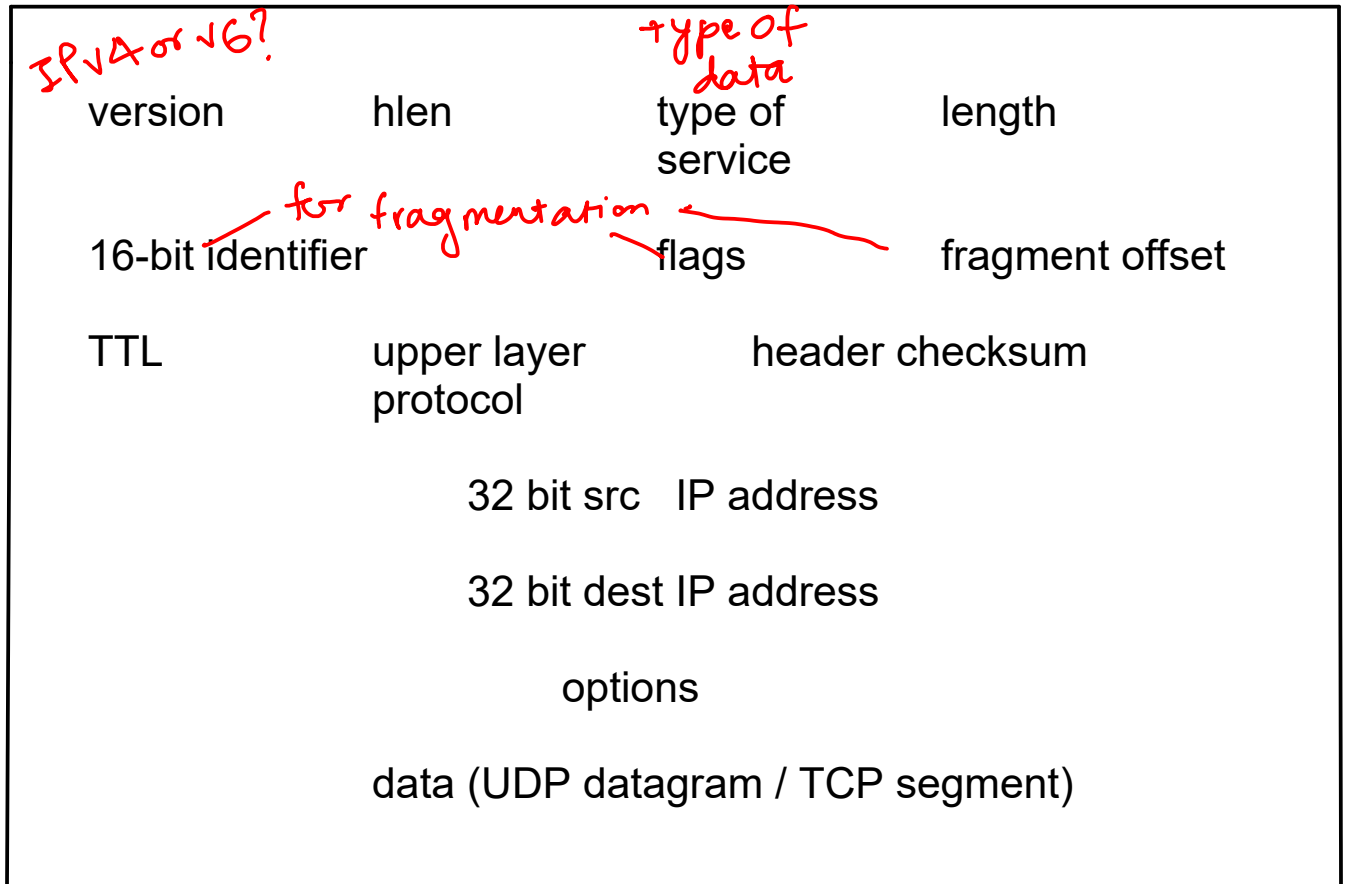

Dest Addr.	Link interface

Longest  
prefix  
matching

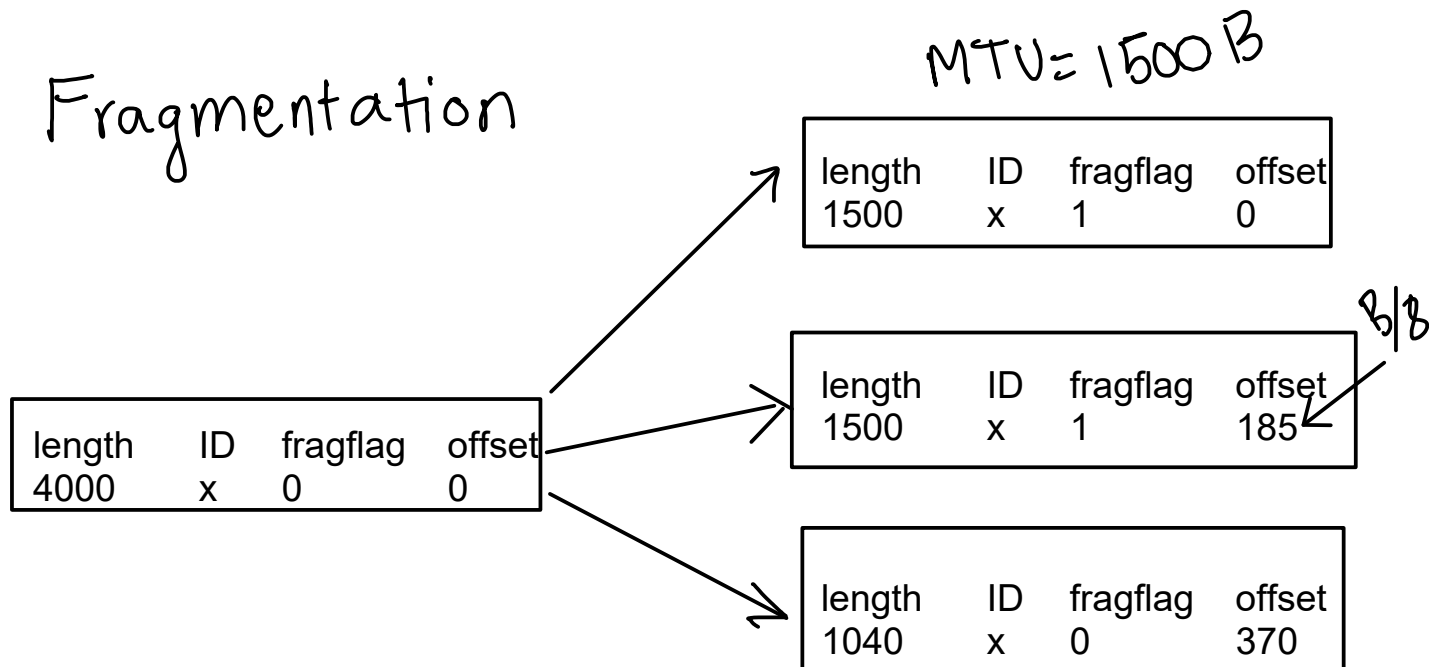

≡ Head of Line Blocking

## IPv4 packet

## Fragmentation

Has 6 subnets

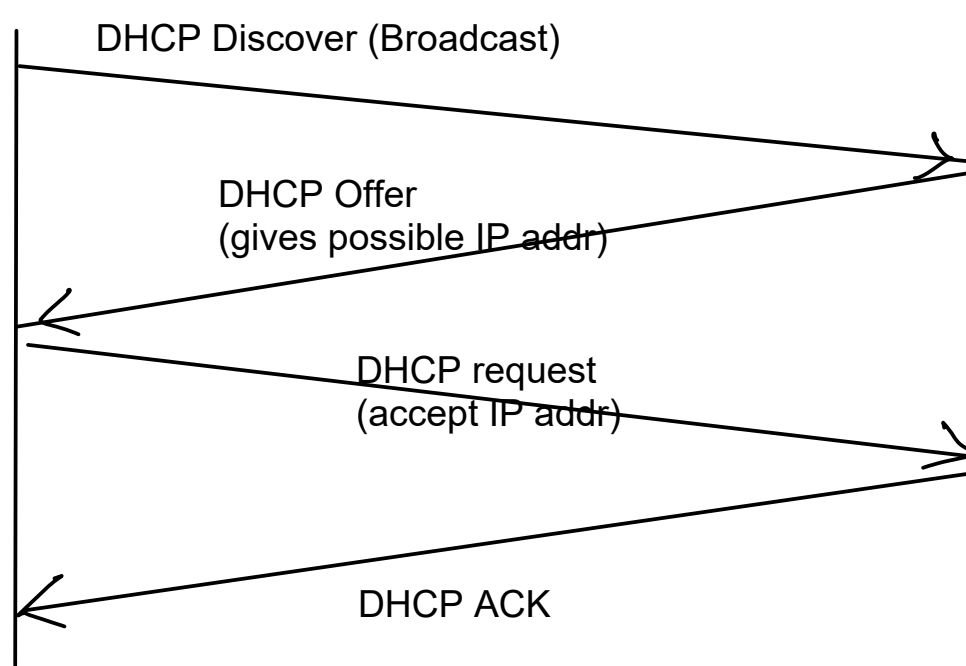

subnets can be thought like  
able to communicate directly

IP CIDR ----> Classless InterDomain Routing  
subnet has arbitrary length

## DHCP (Dynamic Host Config Protocol)

Host

Server

## Network Address translator (NAT)

ICMP: Carried in IP packets, above network layer

### IPv6 packet format

Tunnelling: transmit IPv6 packets on IPv4 routers by putting v6 packets inside the payload of IPv4 packets. dest set to nearest IPv6 router

LinkState, Dijkstra (LS) -  $O(n^2)$  algo,  $O(nE)$  messages

DistVector, Bellman-Ford (DV): Good new fast, poisoned reverse/ count to infinity

AS : Autonomous system

Inter AS routing : every router keeps # hops to that AS

Intra AS routing:

RIP - Router Information Protocol (uses DV algorithm)

OSPF - Open Shortest Path First (uses LS algorithm)

BGP: Border Gateway Protocol

eBGP: gets subnet reachability from neighbour AS

iBGP: propagates reachability info to internal AS routers

More on BGP todo

Hot Potato: Try to take traffic out of your internal network as fast as possible

Cold Potato: Try to keep it in the internal network until you've found the best possible way to transmit
